# Client-Side API for RMI on the Java Card Platform

---

A Java Card™ remote method invocation (Java Card RMI) client application runs on a Card Acceptance Device (CAD) terminal that supports a Java™ Platform, Standard Edition (Java SE) or Java™ Platform, Micro Edition (Java ME). The client application requires a portable and platform independent mechanism to access the Java Card RMI server applet executing on the smart card.

This client-side architecture currently focuses on a Java SE client running on a JDK™ version 1.2 or higher environment. The client interfaces are designed to be independent of the card access framework. The interfaces therefore only provide Java Card RMI-specific access mechanisms and allow the client application to use its preferred card access mechanisms for its basic card interaction needs.

The example in Sun Microsystem's reference implementation uses the APDU I/O library for card access. See the *Development Kit User's Guide, Java Card Platform, Version 2.2.2* provided with this release.

The Java ME environment is more limited, and since most Java ME profiles do not support the Java Card RMI machinery at this time, it is not discussed in detail. The design of the Java Card RMI client-side architecture ensures that it does not preclude the Java ME client.

---

## Basic Features

The Java Card RMI client side architecture caters to the following:

- Provides the client application mechanisms to initialize and initiate an RMI session with a Java Card applet.
- Provides the client application access to the initial remote reference.

- Allows the client application to customize the message packet during communication with a Java Card technology-compliant smart card to introduce transport level security.
- Allows the CAD terminal developer to customize the card access mechanisms for the specifics of the communications hardware.
- Allows the CAD terminal developer to customize the stub generation mechanism for one that is best suited to the platform capabilities.

---

## Client Application Interfaces

These classes provide the basic Java Card RMI client application with the front-end mechanisms to connect to the Java Card applet and obtain an initial reference to invoke remote methods.

### CardAccessor Interface

The `CardAccessor` interface is used by the Java Card RMI client framework to communicate with the card. It defines the following methods:

- `public byte[] exchangeAPDU( byte[] command )`

The Java Card RMI client framework uses this method to send a command APDU to the card and receive the response APDU.

- `public void closeCard()`

This method closes connection with the card and powers down the card.

In the Java Card RMI example provided in this release (see Chapter 3 of the *Development Kit User's Guide, Java Card Platform, Version 2.2.2*), the client application instantiates the `ApduIOCardAccessor`, which implements the `CardAccessor` interface.

### JCRMIConnect Class

The client application uses the `JCRMIConnect` class to initiate the Java Card RMI session and obtain the initial remote reference from the card.

Constructor:

```
public JCRMIConnect(CardAccessor cA)
```

The client constructs an instance of the `JCRMIConnect` class, initializing it with a `CardAccessor` object.

The methods of `JCRMIConnect` are:

- `public byte[] selectApplet(byte[] appletAID, byte format)`  
The client starts a Java Card RMI session with the Java Card applet on the card using this method. The second parameter specifies the format of the remote references and can be either of two constants defined in this class: `REF_WITH_CLASS_NAME` or `REF_WITH_INTERFACE_NAMES`.
- `public Remote getInitialReference()`  
To begin a Java Card RMI-based dialog, the client obtains the first remote object reference via this method and then casts it to the appropriate remote interface type.

## ApduIOCardAccessor Class

This class implements a `CardAccessor` object using the `ApduIO` library. It has a default constructor, which takes initialization parameters from the file `jcclient.properties`, which must be located in one of the directories listed in the `CLASSPATH`.

## Format of the `jcclient.properties` File

The `jcclient.properties` file contains a set of parameters for the `ApduIOCardAccessor`. Each line of the file is in the format `parameter=value`. Comments are preceded with the `#` symbol. All parameter names and values are case-sensitive.

The parameter `connection` is mandatory, with possible values of `TCP`, `SERIAL`, `PCSC`, for example:

```
connection = TCP
```

If the connection is `TCP` or `SERIAL`, the parameter `protocol` is required, with possible values of `T0` and `T1`, for example:

```
protocol = T1
```

If the connection is `TCP`, the parameters `TCP_HOST` and `TCP_PORT` are required, for example:

```
TCP_HOST = localhost
```

```
TCP_PORT = 9025
```

If the connection is `SERIAL`, the parameter `SERIAL_PORT` is required, for example:

```
SERIAL_PORT = COM1
```

Note: If parameter connection is set to PCSC, no other parameters are necessary. The `ApuIOCardAccessor` will attempt to use default sections of the card reader's driver.

## Securing the Transport Layer

A simple Java Card RMI client application would only depend on the above methods for a remote method based card session with a Java Card applet. The Java Card applet might need to layer additional security services to protect the message transport data for integrity and privacy. In order to do this, the client application (or security service provider) could develop its own version of the `CardAccessor` class with the `exchangeAPDU` method performing data transformation. The Java Card RMI example provided in this release contains the `CustomCardAccessor` class, which shows how to perform such a task within its `exchangeAPDU` method.

---

## Stub/Proxy Generation

The client does not usually interact with the client side stub generation classes. It is used by the `JCRMIConnect` class to instantiate the initial remote stub object and subsequently the stub objects themselves to instantiate other remote stub objects.

The client library includes the class `JCCardObjectFactory` that encapsulates the mechanism used to instantiate stubs on the client. The `JCCardObjectFactory` class uses the `SELECT REF_FORMAT_CLASS` format, locates the pre-compiled stub class corresponding to the implementation class name returned in the remote reference descriptor from the card, and then instantiates it.

The client library also includes the class `JCCardProxyFactory`, which uses the `SELECT REF_FORMAT_INTERFACES` format. The dynamic proxy generation mechanism, defined by JDK version 1.3, generates the proxy instances according to the list of remote interfaces implemented by the remote class.

---

# Exceptions

The remote method invoked on the card may throw an exception to signal that an unexpected condition has been detected. The `RMIService` class on the card catches the exception and returns this information to the client.

If the exception thrown on the card is an exception defined in the Java Card API version 2.2.2, the same exception is re-thrown by the stub object back to the client application. The client can access the reason code associated with Java Card platform-specific exceptions using the standard `getReason()` method.

If the exception thrown on the card is a subclass of an exception defined in the Java Card API version 2.2.2, a client subclass of the closest exception defined in the API (along with the reason code, if applicable) is re-thrown to the client by the stub object. The exception object will contain the following error message string: "A subclass was thrown on the card."

Apart from the exceptions thrown by the remote method itself, errors during communication, marshalling, protocol, unmarshalling, stub generation and so forth related to the Java Card RMI method invocation results in a `RemoteException` exception being thrown to the client application with appropriate error message strings which include the following:

- Applet selection failed, `SW = ...`
- Incorrect (too short) response received from the card
- Invalid format requested by the factory
- Invoke operation failed, `SW = ...`
- Method not found
- Object not exported
- Out of param resources
- Out of response resources
- Protocol error reported by the card
- Signature mismatch
- Thrown on the card
- Unexpected exception received while instantiating the stub
- Unsupported APPLICATION tag
- Unsupported error type received from the card
- Unsupported exception type received from the card
- Unsupported FCI tag
- Unsupported Java Card RMI tag
- Unsupported Java Card RMI version
- Unsupported subclass exception type received from the card
- Unsupported tag

## API Documentation

---

A typical Java Card RMI client application would commonly use the following classes from the client-side API. See the RMI-based demos included with the Java Card platform, version 2.2.2 development kit for examples of usage of these classes.

- `package com.sun.javacard.clientlib`
  - `CardAccessor` - as an interface, which must be implemented by any custom card accessor.
  - `ApduIOCardAccessor` - as a base class or as a source code to implement a custom card accessor.
- `package com.sun.javacard.rmiclientlib`
  - `JCRMIConnect` - to select a card applet and to obtain an initial reference.

The remainder of this whitepaper contains a compilation of the API documentation generated by the Javadoc tool for the client-side Java Card RMI application programming interface packages. It includes the classes and interfaces mentioned above, as well as classes that represent various exceptions that may be thrown on the card and re-thrown on the client. Please note the "FRAMES" feature is not supported in this version.

static short	<a href="#"><b>BUFFER_BOUNDS</b></a> This reason code is used by the <code>APDU.sendBytes()</code> method to indicate that the sum of buffer offset parameter and the byte length parameter exceeds the APDU buffer size.
static short	<a href="#"><b>ILLEGAL_USE</b></a> This <code>APDUException</code> reason code indicates that the method should not be invoked based on the current state of the APDU.
static short	<a href="#"><b>IO_ERROR</b></a> This reason code indicates that an unrecoverable error occurred in the I/O transmission layer.
static short	<a href="#"><b>NO_TO_GETRESPONSE</b></a> This reason code indicates that during T=0 protocol, the CAD did not return a GET RESPONSE command in response to a <61xx> response status to send additional data.
static short	<a href="#"><b>NO_TO_REISSUE</b></a> This reason code indicates that during T=0 protocol, the CAD did not reissue the same APDU command with the corrected length in response to a <6Cxx> response status to request command reissue with the specified length.
static short	<a href="#"><b>T1_IFD_ABORT</b></a> This reason code indicates that during T=1 protocol, the CAD returned an ABORT S-Block command and aborted the data transfer.

## Constructor Summary

[\*\*APDUException\*\*](#)(short reason)

Constructs an `APDUException`.

## Method Summary

static void [\*\*throwIt\*\*](#)(short reason)

Throws an instance of `APDUException` with the specified reason.

Methods inherited from class `javacard.framework`.[\*\*CardRuntimeException\*\*](#)

[\*\*getReason\*\*](#), [\*\*setReason\*\*](#)

Methods inherited from class `java.lang.Throwable`

```
fillInStackTrace, getCause, getLocalizedMessage, getMessage,  
getStackTrace, initCause, printStackTrace, printStackTrace,  
printStackTrace, setStackTrace, toString
```

### Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll,  
wait, wait, wait
```

## Field Detail

### ILLEGAL\_USE

```
public static final short ILLEGAL_USE
```

This APDUException reason code indicates that the method should not be invoked based on the current state of the APDU.

**See Also:**

[Constant Field Values](#)

---

### BUFFER\_BOUNDS

```
public static final short BUFFER_BOUNDS
```

This reason code is used by the `APDU.sendBytes()` method to indicate that the sum of buffer offset parameter and the byte length parameter exceeds the APDU buffer size.

**See Also:**

[Constant Field Values](#)

---

### BAD\_LENGTH

```
public static final short BAD_LENGTH
```

This reason code is used by the `APDU.setOutgoingLength()` method to indicate that the length parameter is greater than 256 or if non BLOCK CHAINED data transfer is requested and `len` is greater than (IFSD-2), where IFSD is the Outgoing Block Size.

**See Also:**

[Constant Field Values](#)

---

## IO\_ERROR

```
public static final short IO_ERROR
```

This reason code indicates that an unrecoverable error occurred in the I/O transmission layer.

**See Also:**

[Constant Field Values](#)

---

## NO\_T0\_GETRESPONSE

```
public static final short NO_T0_GETRESPONSE
```

This reason code indicates that during T=0 protocol, the CAD did not return a GET RESPONSE command in response to a <61xx> response status to send additional data. The outgoing transfer has been aborted. No more data or status can be sent to the CAD in this `APDU.process()` method.

**See Also:**

[Constant Field Values](#)

---

## T1\_IFD\_ABORT

```
public static final short T1_IFD_ABORT
```

This reason code indicates that during T=1 protocol, the CAD returned an ABORT S-Block

command and aborted the data transfer. The incoming or outgoing transfer has been aborted. No more data can be received from the CAD. No more data or status can be sent to the CAD in this `APDU.process()` method.

**See Also:**

[Constant Field Values](#)

---

## NO\_T0\_REISSUE

```
public static final short NO_T0_REISSUE
```

This reason code indicates that during T=0 protocol, the CAD did not reissue the same APDU command with the corrected length in response to a <6Cxx> response status to request command reissue with the specified length. The outgoing transfer has been aborted. No more data or status can be sent to the CAD in this `APDU.process()` method.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### APDUException

```
public APDUException(short reason)
```

Constructs an `APDUException`.

**Parameters:**

`reason` - the reason for the exception.

## Method Detail

### throwIt

```
public static void throwIt(short reason)
```

Throws an instance of `APDUException` with the specified reason.

**Parameters:**

`reason` - the reason for the exception.

**Throws:**

[APDUException](#) - always.

## A

**[APDUException](#)** - Exception in [javacard.framework](#)

`APDUException` represents an APDU related exception.

**[APDUException\(short\)](#)** - Constructor for exception [javacard.framework.APDUException](#)

Constructs an `APDUException`.

**[APDUExceptionSubclass](#)** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of `APDUException`.

**[APDUExceptionSubclass\(String, short\)](#)** - Constructor for exception [com.sun.javacard.javax.smartcard.rmiclient.APDUExceptionSubclass](#)

Constructs an `APDUExceptionSubclass` with the specified reason and specified error message.

**[ApuIOCardAccessor](#)** - Class in [com.sun.javacard.clientlib](#)

Implementation of `CardAccessor` using `ApuIO` library

**[ApuIOCardAccessor\(\)](#)** - Constructor for class [com.sun.javacard.clientlib.ApuIOCardAccessor](#)

Creates a new instance of `ApuIOCardAccessor`

---

## B

**[BAD\\_LENGTH](#)** - Static variable in exception [javacard.framework.APDUException](#)

This reason code is used by the `APDU.setOutgoingLength()` method to indicate that the length parameter is greater than 256 or if non BLOCK CHAINED data transfer is requested and `len` is greater than (IFSD-2), where IFSD is the Outgoing Block Size.

**[BioException](#)** - Exception in [javacardx.biometry](#)

The `BioException` class encapsulates specific exceptions which can be thrown by the methods of the `javacardx.biometry` package in case of error.

**[BioException\(short\)](#)** - Constructor for exception [javacardx.biometry.BioException](#)

Construct a new biometric exception using a provided reason code.

**[BioExceptionSubclass](#)** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

The `BioException` class encapsulates specific exceptions which can be thrown by the methods of the `javacardx.biometry` package in case of error.

**[BioExceptionSubclass\(String, short\)](#)** - Constructor for exception [com.sun.javacard.javax.smartcard.rmiclient.BioExceptionSubclass](#)

**BUFFER\_BOUNDS** - Static variable in exception [javacard.framework.APDUException](#)

This reason code is used by the `APDU.sendBytes()` method to indicate that the sum of buffer offset parameter and the byte length parameter exceeds the APDU buffer size.

**BUFFER\_FULL** - Static variable in exception [javacard.framework.TransactionException](#)

This reason code is used during a transaction to indicate that the commit buffer is full.

---

## C

**cad** - Variable in class [com.sun.javacard.clientlib.ApduIOCardAccessor](#)

Reference to underlying `ApduIO` object.

**CANNOT\_ACCESS\_IN\_COMMAND** - Static variable in exception [javacard.framework.service.ServiceException](#)

This reason code is used to indicate that the command in the APDU object cannot be accessed for input processing.

**CANNOT\_ACCESS\_OUT\_COMMAND** - Static variable in exception [javacard.framework.service.ServiceException](#)

This reason code is used to indicate that the command in the APDU object cannot be accessed for output processing.

**CardAccessor** - Interface in [com.sun.javacard.clientlib](#)

The `CardAccessor` interface represents a generic smartcard communication API.

**CardException** - Exception in [javacard.framework](#)

The `CardException` class defines a field `reason` and two accessor methods `getReason()` and `setReason()`.

**CardException(short)** - Constructor for exception [javacard.framework.CardException](#)

Construct a `CardException` instance with the specified reason.

**CardExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a subclass of `CardException` on the card.

**CardExceptionSubclass(String, short)** - Constructor for exception [com.sun.javacard.javax.smartcard.rmiclient.CardExceptionSubclass](#)

Construct a `CardExceptionSubclass` instance with the specified reason and the specified error message.

**CardObjectFactory** - Class in [com.sun.javacard.javax.smartcard.rmiclient](#)

This `CardObjectFactory` abstract class represents the base class for Java Card RMI version 2.2.2 stub generation implementations.

**CardObjectFactory()** - Constructor for class [com.sun.javacard.javax.smartcard.rmiclient.CardObjectFactory](#)

Creates a new `CardObjectFactory` for this RMI session

**CardRuntimeException** - Exception in [javacard.framework](#)

The `CardRuntimeException` class defines a field `reason` and two accessor methods `getReason()` and `setReason()`.

**CardRuntimeException(short)** - Constructor for exception [javacard.framework](#).

**CardRuntimeException**

Construct a `CardRuntimeException` instance with the specified reason.

**CardRuntimeExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a subclass of `CardRuntimeException` on the card.

**CardRuntimeExceptionSubclass(String, short)** - Constructor for exception [com.sun.javacard.javax.smartcard.rmiclient](#).  
**CardRuntimeExceptionSubclass**

Construct a `CardRuntimeExceptionSubclass` instance with the specified reason and the specified error message.

**closeCard()** - Method in class [com.sun.javacard.clientlib](#).  
**ApduIOCardAccessor**

Close and powerdown the card.

**closeCard()** - Method in interface [com.sun.javacard.clientlib](#).  
**CardAccessor**

This method closes and resets the card

**com.sun.javacard.clientlib** - package [com.sun.javacard.clientlib](#)

Provides a framework for building client applications capable of exchanging APDUs with Java Cards.

**com.sun.javacard.javax.smartcard.rmiclient** - package [com.sun.javacard.javax.smartcard.rmiclient](#)

Provides framework of classes and interfaces for a Java Card technology-based client.

**com.sun.javacard.rmiclientlib** - package [com.sun.javacard.rmiclientlib](#)

Provides a framework of classes and interfaces for building Java Card RMI-based client applications.

**COMMAND\_DATA\_TOO\_LONG** - Static variable in exception [javacard.framework.service](#).

**ServiceException**

This reason code is used to indicate that the incoming data for a command in the APDU object does not fit in the APDU buffer.

**COMMAND\_IS\_FINISHED** - Static variable in exception [javacard.framework.service](#).

**ServiceException**

This reason code is used to indicate that the command in the APDU object has been completely processed.

**CryptoException** - Exception in [javacard.security](#)

`CryptoException` represents a cryptography-related exception.

**CryptoException(short)** - Constructor for exception [javacard.security](#).  
**CryptoException**

Constructs a `CryptoException` with the specified reason.

**CryptoExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of `CryptoException`.

**CryptoExceptionSubclass(String, short)** - Constructor for exception [com.sun.javacard.javax.smartcard.rmiclient](#).  
**CryptoExceptionSubclass**

Constructs an `CryptoExceptionSubclass` with the specified reason and specified error message.

---

## D

**[DISPATCH\\_TABLE\\_FULL](#)** - Static variable in exception `javacard.framework.service.ServiceException`

This reason code is used to indicate that a dispatch table is full

**[done\(RemoteCall\)](#)** - Method in class `com.sun.javacard.rmiclientlib.JCRemoteRefImpl`  
**Deprecated.**

---

## E

**[EMPTY\\_TAG](#)** - Static variable in exception `javacardx.framework.tlv.TLVException`

This reason code is used to indicate that the Tag object is empty

**[EMPTY\\_TLV](#)** - Static variable in exception `javacardx.framework.tlv.TLVException`

This reason code is used to indicate that the TLV object is empty

**[exchangeAPDU\(byte\[\]\)](#)** - Method in class `com.sun.javacard.clientlib.ApduIOCardAccessor`

Implementation of `exchangeAPDU` method of `CardAccessor` interface

**[exchangeAPDU\(byte\[\]\)](#)** - Method in interface `com.sun.javacard.clientlib.CardAccessor`

This method sends the specified data to the smartcard, waits for the response and returns the response in the return data.

**[ExternalException](#)** - Exception in `javacardx.external`

`ExternalException` represents an external subsystem related exception.

**[ExternalException\(short\)](#)** - Constructor for exception `javacardx.external.ExternalException`

Constructs a `ExternalException` with the specified reason.

**[ExternalExceptionSubclass](#)** - Exception in `com.sun.javacard.javax.smartcard.rmiclient`

`ExternalException` represents an external subsystem related exception.

**[ExternalExceptionSubclass\(String, short\)](#)** - Constructor for exception `com.sun.javacard.javax.smartcard.rmiclient.ExternalExceptionSubclass`

---

## F

**format** - Variable in class com.sun.javacard.rmiclientlib.[JCRMICConnect](#)

Format of the remote references.

---

## G

**getInitialReference()** - Method in class com.sun.javacard.rmiclientlib.[JCRMICConnect](#)

Parses the R-APDU which was returned during selecting an applet, returns a reference to an initial remote object

**getINSByte()** - Method in class com.sun.javacard.javax.smartcard.rmiclient.[CardObjectFactory](#)

returns the configured ISO 7816-4 command INS byte to be used in the Java Card platform remote method invocation command

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[APDUExceptionSubclass](#)

Returns the error message string of this throwable object.

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[BioExceptionSubclass](#)

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[CardExceptionSubclass](#)

Returns the error message string of this throwable object.

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[CardRuntimeExceptionSubclass](#)

Returns the error message string of this throwable object.

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[CryptoExceptionSubclass](#)

Returns the error message string of this throwable object.

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[ExternalExceptionSubclass](#)

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[ISOExceptionSubclass](#)

Returns the error message string of this throwable object.

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[PINExceptionSubclass](#)

Returns the error message string of this throwable object.

**getMessage()** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.[ServiceExceptionSubclass](#)

Returns the error message string of this throwable object.

**[getMessage\(\)](#)** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.  
SystemExceptionSubclass

Returns the error message string of this throwable object.

**[getMessage\(\)](#)** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.  
TLVExceptionSubclass

Returns the error message string of this throwable object.

**[getMessage\(\)](#)** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.  
TransactionExceptionSubclass

Returns the error message string of this throwable object.

**[getMessage\(\)](#)** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.  
UserExceptionSubclass

Returns the error message string of this throwable object.

**[getMessage\(\)](#)** - Method in exception com.sun.javacard.javax.smartcard.rmiclient.  
UtilExceptionSubclass

**[getObject\(byte\[\], int, Class, CardAccessor\)](#)** - Method in class com.sun.javacard.javax.smartcard.  
rmiclient.CardObjectFactory

This abstract method returns the instance of the card object corresponding to the value returned from the card.

**[getReason\(\)](#)** - Method in exception javacard.framework.CardException

Get reason code

**[getReason\(\)](#)** - Method in exception javacard.framework.CardRuntimeException

Get reason code

**[getRefClass\(ObjectOutput\)](#)** - Method in class com.sun.javacard.rmiclientlib.JCRemoteRefImpl

Unsupported operation.

**[getRemoteObject\(byte\[\], int, CardAccessor\)](#)** - Method in class com.sun.javacard.javax.smartcard.  
rmiclient.CardObjectFactory

This abstract method instantiates a stub or proxy object corresponding to the remote reference returned from the card

**[getRemoteObject\(byte\[\], int, CardAccessor\)](#)** - Method in class com.sun.javacard.rmiclientlib.  
JCCardObjectFactory

Creates the stub instance for object reference returned from the card, assuming the card returned a reference with class name.

**[getRemoteObject\(byte\[\], int, CardAccessor\)](#)** - Method in class com.sun.javacard.rmiclientlib.  
JCCardProxyFactory

Creates the stub instance for object reference returned from the card, assuming the card returned a reference with list of interface names.

**[getRemoteRefFormat\(\)](#)** - Method in class com.sun.javacard.javax.smartcard.rmiclient.  
CardObjectFactory

returns the format of Java Card RMI remote object reference descriptor supported.

**[getRemoteRefFormat\(\)](#)** - Method in class `com.sun.javacard.rmiclientlib.JCCardObjectFactory`

Returns constant `REF_FORMAT_CLASS` defined in class `CardObjectFactory`.

**[getRemoteRefFormat\(\)](#)** - Method in class `com.sun.javacard.rmiclientlib.JCCardProxyFactory`

Returns constant `REF_FORMAT_INTERFACES` defined in class `CardObjectFactory`.

---

I

**[ILLEGAL\\_AID](#)** - Static variable in exception `javacard.framework.SystemException`

This reason code is used by the `javacard.framework.Applet.register()` method to indicate that the input AID parameter is not a legal AID value.

**[ILLEGAL\\_PARAM](#)** - Static variable in exception `javacard.framework.service.ServiceException`

This reason code is used to indicate that an input parameter is not allowed.

**[ILLEGAL\\_SIZE](#)** - Static variable in exception `javacardx.framework.tlv.TLVException`

This reason code is used to indicate that the size of a TLV or Tag representation in the input parameter is greater than the supported size or will result in a TLV structure of greater than supported size

**[ILLEGAL\\_TRANSIENT](#)** - Static variable in exception `javacard.framework.SystemException`

This reason code is used to indicate that the request to create a transient object is not allowed in the current applet context.

**[ILLEGAL\\_USE](#)** - Static variable in exception `javacard.framework.APDUException`

This `APDUException` reason code indicates that the method should not be invoked based on the current state of the APDU.

**[ILLEGAL\\_USE](#)** - Static variable in exception `javacard.framework.SystemException`

This reason code is used to indicate that the requested function is not allowed.

**[ILLEGAL\\_USE](#)** - Static variable in exception `javacard.security.CryptoException`

This reason code is used to indicate that the signature or cipher algorithm does not pad the incoming message and the input message is not block aligned.

**[ILLEGAL\\_USE](#)** - Static variable in exception `javacardx.biometry.BioException`

This reason code is used to indicate that the method should not be invoked based on the current state of the card.

**[ILLEGAL\\_VALUE](#)** - Static variable in exception `javacard.framework.PINException`

This reason code is used to indicate that one or more input parameters is out of allowed bounds.

**[ILLEGAL\\_VALUE](#)** - Static variable in exception `javacard.framework.SystemException`

This reason code is used to indicate that one or more input parameters is out of allowed bounds.

**[ILLEGAL\\_VALUE](#)** - Static variable in exception `javacard.security.CryptoException`

This reason code is used to indicate that one or more input parameters is out of allowed bounds.

**[ILLEGAL\\_VALUE](#)** - Static variable in exception `javacardx.biometry.BioException`

This reason code is used to indicate that one or more input parameters is out of allowed bounds.

**ILLEGAL\_VALUE** - Static variable in exception javacardx.framework.util.[UtilException](#)

This reason code is used to indicate that one or more input parameters is not the correct type or is out of allowed bounds.

**IN\_PROGRESS** - Static variable in exception javacard.framework.[TransactionException](#)

This reason code is used by the `beginTransaction` method to indicate a transaction is already in progress.

**INSUFFICIENT\_STORAGE** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the configured storage capacity of the object will be exceeded

**INTERNAL\_ERROR** - Static variable in exception javacardx.external.[ExternalException](#)

This reason code is used to indicate that an unrecoverable external access error occurred.

**INTERNAL\_FAILURE** - Static variable in exception javacard.framework.[TransactionException](#)

This reason code is used during a transaction to indicate an internal Java Card runtime environment problem (fatal error).

**INVALID\_DATA** - Static variable in exception javacardx.biometry.[BioException](#)

This reason code is used to indicate that the data the system encountered is illegible.

**INVALID\_INIT** - Static variable in exception javacard.security.[CryptoException](#)

This reason code is used to indicate that the signature or cipher object has not been correctly initialized for the requested operation.

**INVALID\_PARAM** - Static variable in exception javacardx.external.[ExternalException](#)

This reason code is used to indicate that an input parameter is invalid.

**INVALID\_PARAM** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that one or more input parameters is invalid.

**invoke(Remote, Method, Object[], long)** - Method in class com.sun.javacard.rmiclientlib.

[JCRemoteRefImpl](#)

This method is used by rmic-generated stubs.

**invoke(RemoteCall)** - Method in class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

**Deprecated.**

**invoke(Object, Method, Object[])** - Method in class com.sun.javacard.rmiclientlib.

[JCRemoteRefImpl](#)

This method is used by dynamically generated proxies.

**IO\_ERROR** - Static variable in exception javacard.framework.[APDUException](#)

This reason code indicates that an unrecoverable error occurred in the I/O transmission layer.

**ISOException** - Exception in [javacard.framework](#)

`ISOException` class encapsulates an ISO 7816-4 response status word as its reason code.

**ISOException(short)** - Constructor for exception javacard.framework.[ISOException](#)

Constructs an `ISOException` instance with the specified status word.

**ISOExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of `ISOException`.

**ISOExceptionSubclass(String, short)** - Constructor for exception com.sun.javacard.javax.smartcard.

rmiclient.[ISOExceptionSubclass](#)

Constructs an ISOExceptionSubclass with the specified reason and specified error message.

---

## J

[javacard.framework](#) - package javacard.framework

Provides Java Card API exceptions that may be re-thrown on the client.

[javacard.framework.service](#) - package javacard.framework.service

Provides Java Card API exceptions that may be re-thrown on the client.

[javacard.security](#) - package javacard.security

Provides Java Card platform exceptions that may be re-thrown on the client.

[javacardx.biometry](#) - package javacardx.biometry

Extension package that contains functionality for implementing a biometric framework on the Java Card platform.

[javacardx.external](#) - package javacardx.external

Extension package that provides mechanisms to access memory subsystems which are not directly addressable by the Java Card runtime environment(Java Card RE) on the Java Card platform.

[javacardx.framework.tlv](#) - package javacardx.framework.tlv

Extension package that contains functionality, for managing storage for BER TLV formatted data, based on the ASN.1 BER encoding rules of ISO/IEC 8825-1:2002, as well as parsing and editing BER TLV formatted data in I/O buffers.

[javacardx.framework.util](#) - package javacardx.framework.util

Extension package that contains common utility functions for manipulating arrays of primitive components - byte, short or int.

[JCCardObjectFactory](#) - Class in [com.sun.javacard.rmiclientlib](#)

Processes the data returned from the card in the format defined for Java Card RMI.

[JCCardObjectFactory\(\)](#) - Constructor for class com.sun.javacard.rmiclientlib.[JCCardObjectFactory](#)

The constructor.

[JCCardProxyFactory](#) - Class in [com.sun.javacard.rmiclientlib](#)

Processes the data returned from the card in the format defined for Java Card RMI.

[JCCardProxyFactory\(\)](#) - Constructor for class com.sun.javacard.rmiclientlib.[JCCardProxyFactory](#)

Constructor for the factory.

[JCRemoteRefImpl](#) - Class in [com.sun.javacard.rmiclientlib](#)

Represents a reference to a card object.

[JCRemoteRefImpl\(short, String, CardAccessor, CardObjectFactory\)](#) - Constructor for class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

Creates new JCRemoteRefImpl

**JCRMIConnect** - Class in [com.sun.javacard.rmiclientlib](#)

The main class of the Java Card RMI client API.

**JCRMIConnect(CardAccessor)** - Constructor for class com.sun.javacard.rmiclientlib.

**JCRMIConnect**

Creates a new instance of JCRMIConnect

---

## M

**MALFORMED\_TAG** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the tag representation is not a well-formed BER Tag

**MALFORMED\_TLV** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the TLV representation is not a well-formed BER TLV

---

## N

**newCall(RemoteObject, Operation[], int, long)** - Method in class com.sun.javacard.rmiclientlib.

**JCRemoteRefImpl**

**Deprecated.**

**NO\_RESOURCE** - Static variable in exception javacard.framework.[SystemException](#)

This reason code is used to indicate that there is insufficient resource in the Card for the request.

**NO\_SUCH\_ALGORITHM** - Static variable in exception javacard.security.[CryptoException](#)

This reason code is used to indicate that the requested algorithm or key type is not supported.

**NO\_SUCH\_BIO\_TEMPLATE** - Static variable in exception javacardx.biometry.[BioException](#)

This reason code is used to indicate that the provided bio template type is not supported by the template builder.

**NO\_SUCH\_SUBSYSTEM** - Static variable in exception javacardx.external.[ExternalException](#)

This reason code is used to indicate that specified external subsystem is not available.

**NO\_T0\_GETRESPONSE** - Static variable in exception javacard.framework.[APDUException](#)

This reason code indicates that during T=0 protocol, the CAD did not return a GET RESPONSE command in response to a <61xx> response status to send additional data.

**NO\_T0\_REISSUE** - Static variable in exception javacard.framework.[APDUException](#)

This reason code indicates that during T=0 protocol, the CAD did not reissue the same APDU command with the corrected length in response to a <6Cxx> response status to request command reissue with the specified length.

**NO\_TEMPLATES\_ENROLLED** - Static variable in exception javacardx.biometry.[BioException](#)

This reason code is used to indicate that no reference template is available for matching, or that the reference template is uninitialized.

**NO\_TRANSIENT\_SPACE** - Static variable in exception javacard.framework.[SystemException](#)

This reason code is used by the `makeTransient...()` methods to indicate that no room is available in volatile memory for the requested object.

**NOT\_IN\_PROGRESS** - Static variable in exception javacard.framework.[TransactionException](#)

This reason code is used by the `abortTransaction` and `commitTransaction` methods when a transaction is not in progress.

---

## P

**PINException** - Exception in [javacard.framework](#)

`PINException` represents a `OwnerPIN` class access-related exception.

**PINException(short)** - Constructor for exception javacard.framework.[PINException](#)

Constructs a `PINException`.

**PINExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of `PINException`.

**PINExceptionSubclass(String, short)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[PINExceptionSubclass](#)

Constructs an `PINExceptionSubclass` with the specified reason and specified error message.

---

## R

**readExternal(ObjectInput)** - Method in class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

Unsupported operation.

**REF\_FORMAT\_CLASS** - Static variable in class com.sun.javacard.javax.smartcard.rmiclient.[CardObjectFactory](#)

This value (=1) is used to signify that the `CardObjectFactory` implementation supports the Java Card RMI remote reference format using the name of the card implementation remote class.

**REF\_FORMAT\_INTERFACES** - Static variable in class com.sun.javacard.javax.smartcard.rmiclient.[CardObjectFactory](#)

This value (=2) is used to signify that the `CardObjectFactory` implementation supports the Java Card RMI remote reference format using the names of the remote interfaces implemented by the card implementation remote class.

**REF\_FORMAT\_NONE** - Static variable in class com.sun.javacard.javax.smartcard.rmiclient.

## CardObjectFactory

This value (=0) is used to signify that the CardObjectFactory implementation does not support any Java Card RMI remote reference descriptor formats.

**REF\_WITH\_CLASS\_NAME** - Static variable in class com.sun.javacard.rmiclientlib.[JCRMIConnect](#)

Constant used as the 2nd parameter to selectApplet method.

**REF\_WITH\_INTERFACE\_NAMES** - Static variable in class com.sun.javacard.rmiclientlib.

## JCRMIConnect

Constant used as the 2nd parameter to selectApplet method.

**REMOTE\_OBJECT\_NOT\_EXPORTED** - Static variable in exception javacard.framework.service.

## ServiceException

This reason code is used by RMIService to indicate that the remote method returned an remote object which has not been exported.

**remoteEquals(RemoteRef)** - Method in class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

Compares two remote objects for being identical.

**remoteHashCode()** - Method in class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

Unsupported operation.

**remoteToString()** - Method in class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

String representation of remote object.

---

## S

**selectApplet(byte[], byte)** - Method in class com.sun.javacard.rmiclientlib.[JCRMIConnect](#)

Selects an applet, requesting initial reference in the format specified by the 2nd parameter.

**selectResponse** - Variable in class com.sun.javacard.rmiclientlib.[JCRMIConnect](#)

Response to the SELECT command is stored in this field.

**ServiceException** - Exception in [javacard.framework.service](#)

ServiceException represents a service framework related exception.

**ServiceException(short)** - Constructor for exception javacard.framework.service.[ServiceException](#)

Constructs a ServiceException.

**ServiceExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of ServiceException.

**ServiceExceptionSubclass(String, short)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[ServiceExceptionSubclass](#)

Constructs an ServiceExceptionSubclass with the specified reason and specified error message.

**setINSByte(byte)** - Method in class com.sun.javacard.javax.smartcard.rmiclient.[CardObjectFactory](#)

Sets the ISO 7816-4 header INS byte to use for Java Card RMI method invocation commands.

**setReason(short)** - Method in exception javacard.framework.[CardException](#)

Set reason code.

**setReason(short)** - Method in exception javacard.framework.[CardRuntimeException](#)

Set reason code.

**SystemException** - Exception in [javacard.framework](#)

SystemException represents a JCSYSTEM class related exception.

**SystemException(short)** - Constructor for exception javacard.framework.[SystemException](#)

Constructs a SystemException.

**SystemExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of SystemException.

**SystemExceptionSubclass(String, short)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[SystemExceptionSubclass](#)

Constructs an SystemExceptionSubclass with the specified reason and specified error message.

---

## T

**T1\_IFD\_ABORT** - Static variable in exception javacard.framework.[APDUException](#)

This reason code indicates that during T=1 protocol, the CAD returned an ABORT S-Block command and aborted the data transfer.

**TAG\_NUMBER\_GREATER\_THAN\_32767** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the tag number value greater than 32767

**TAG\_SIZE\_GREATER\_THAN\_127** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the size of the tag representation is greater than 127 bytes

**throwIt(short)** - Static method in exception javacard.framework.[APDUException](#)

Throws an instance of APDUException with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.[CardException](#)

Throw an instance of CardException class with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.[CardRuntimeException](#)

Throw an instance of the CardRuntimeException class with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.[ISOException](#)

Throws an instance of the ISOException class with the specified status word.

**throwIt(short)** - Static method in exception javacard.framework.[PINException](#)

Throws an instance of PINException with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.service.[ServiceException](#)

Throws an instance of ServiceException with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.[SystemException](#)

Throws an instance of SystemException with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.[TransactionException](#)

Throws an instance of `TransactionException` with the specified reason.

**throwIt(short)** - Static method in exception javacard.framework.[UserException](#)

Throws an instance of `UserException` with the specified reason.

**throwIt(short)** - Static method in exception javacard.security.[CryptoException](#)

Throws an instance of `CryptoException` with the specified reason.

**throwIt(short)** - Static method in exception javacardx.biometry.[BioException](#)

Throws the Java Card runtime environment owned instance of `BioException` with the specified reason.

**throwIt(short)** - Static method in exception javacardx.external.[ExternalException](#)

Throws the Java Card runtime environment-owned instance of `ExternalException` with the specified reason.

**throwIt(short)** - Static method in exception javacardx.framework.tlv.[TLVException](#)

Throws the Java Card runtime environment-owned instance of `TLVException` with the specified reason.

**throwIt(short)** - Static method in exception javacardx.framework.util.[UtilException](#)

Throws the Java Card runtime environment-owned instance of `UtilException` with the specified reason.

**TLV\_LENGTH\_GREATER\_THAN\_32767** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the Length component value in the TLV is greater than 32767

**TLV\_SIZE\_GREATER\_THAN\_32767** - Static variable in exception javacardx.framework.tlv.[TLVException](#)

This reason code is used to indicate that the TLV requires more that 32767 bytes to represent

**TLVException** - Exception in [javacardx.framework.tlv](#)

`TLVException` represents a TLV-related exception.

**TLVException(short)** - Constructor for exception javacardx.framework.tlv.[TLVException](#)

Constructs a `TLVException` with the specified reason.

**TLVExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

`TLVException` represents a TLV-related exception.

**TLVExceptionSubclass(String, short)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[TLVExceptionSubclass](#)

**TransactionException** - Exception in [javacard.framework](#)

`TransactionException` represents an exception in the transaction subsystem.

**TransactionException(short)** - Constructor for exception javacard.framework.[TransactionException](#)

Constructs a `TransactionException` with the specified reason.

**TransactionExceptionSubclass** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of `TransactionException`.

**[TransactionExceptionSubclass\(String, short\)](#)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[TransactionExceptionSubclass](#)

Constructs an `TransactionExceptionSubclass` with the specified reason and specified error message.

**[TYPE\\_MISMATCHED](#)** - Static variable in exception javacardx.framework.util.[UtilException](#)

This reason code is used to indicate that input parameters are not the same type.

---

## U

**[UNINITIALIZED\\_KEY](#)** - Static variable in exception javacard.security.[CryptoException](#)

This reason code is used to indicate that the key is uninitialized.

**[UserException](#)** - Exception in [javacard.framework](#)

`UserException` represents a User exception.

**[UserException\(\)](#)** - Constructor for exception javacard.framework.[UserException](#)

Constructs a `UserException` with reason = 0.

**[UserException\(short\)](#)** - Constructor for exception javacard.framework.[UserException](#)

Constructs a `UserException` with the specified reason.

**[UserExceptionSubclass](#)** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

This exception class represents a card subclass of `UserException`.

**[UserExceptionSubclass\(String, short\)](#)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[UserExceptionSubclass](#)

Constructs an `UserExceptionSubclass` with the specified reason and specified error message.

**[UtilException](#)** - Exception in [javacardx.framework.util](#)

`UtilException` represents a util related exception.

**[UtilException\(short\)](#)** - Constructor for exception javacardx.framework.util.[UtilException](#)

Constructs a `UtilException` with the specified reason.

**[UtilExceptionSubclass](#)** - Exception in [com.sun.javacard.javax.smartcard.rmiclient](#)

`UtilException` represents a util related exception.

**[UtilExceptionSubclass\(String, short\)](#)** - Constructor for exception com.sun.javacard.javax.smartcard.rmiclient.[UtilExceptionSubclass](#)

---

## W

**[writeExternal\(ObjectOutput\)](#)** - Method in class com.sun.javacard.rmiclientlib.[JCRemoteRefImpl](#)

Unsupported operation.

## How This API Document Is Organized

This API (Application Programming Interface) document has pages corresponding to the items in the navigation bar, described as follows.

### Overview

The [Overview](#) page is the front page of this API document and provides a list of all packages with a summary for each. This page can also contain an overall description of the set of packages.

### Package

Each package has a page that contains a list of its classes and interfaces, with a summary for each. This page can contain four categories:

- Interfaces (*italic*)
- Classes
- Enums
- Exceptions
- Errors
- Annotation Types

### Class/Interface

Each class, interface, nested class and nested interface has its own separate page. Each of these pages has three sections consisting of a class/interface description, summary tables, and detailed member descriptions:

- Class inheritance diagram
- Direct Subclasses
- All Known Subinterfaces
- All Known Implementing Classes
- Class/interface declaration
- Class/interface description

- Nested Class Summary
  - Field Summary
  - Constructor Summary
  - Method Summary
- 
- Field Detail
  - Constructor Detail
  - Method Detail

Each summary entry contains the first sentence from the detailed description for that item. The summary entries are alphabetical, while the detailed descriptions are in the order they appear in the source code. This preserves the logical groupings established by the programmer.

## Annotation Type

Each annotation type has its own separate page with the following sections:

- Annotation Type declaration
- Annotation Type description
- Required Element Summary
- Optional Element Summary
- Element Detail

## Enum

Each enum has its own separate page with the following sections:

- Enum declaration
- Enum description
- Enum Constant Summary
- Enum Constant Detail

## Tree (Class Hierarchy)

There is a [Class Hierarchy](#) page for all packages, plus a hierarchy for each package. Each hierarchy page contains a list of classes and a list of interfaces. The classes are organized by inheritance structure starting with `java.lang.Object`. The interfaces do not inherit from `java.lang.Object`.

- When viewing the Overview page, clicking on "Tree" displays the hierarchy for

- all packages.
- When viewing a particular package, class or interface page, clicking "Tree" displays the hierarchy for only that package.

## Deprecated API

The [Deprecated API](#) page lists all of the API that have been deprecated. A deprecated API is not recommended for use, generally due to improvements, and a replacement API is usually given. Deprecated APIs may be removed in future implementations.

## Index

The [Index](#) contains an alphabetic list of all classes, interfaces, constructors, methods, and fields.

## Prev/Next

These links take you to the next or previous class, interface, package, or related page.

## Frames/No Frames

These links show and hide the HTML frames. All pages are available with or without frames.

## Constant Field Values

The [Constant Field Values](#) page lists the static final fields and their values.

*This help file applies to API documentation generated using the standard doclet.*

## Package javacard.framework

Provides Java Card API exceptions that may be re-thrown on the client.

See:

[Description](#)

### Exception Summary

<a href="#">APDUException</a>	APDUException represents an APDU related exception.
<a href="#">CardException</a>	The CardException class defines a field <code>reason</code> and two accessor methods <code>getReason()</code> and <code>setReason()</code> .
<a href="#">CardRuntimeException</a>	The CardRuntimeException class defines a field <code>reason</code> and two accessor methods <code>getReason()</code> and <code>setReason()</code> .
<a href="#">ISOException</a>	ISOException class encapsulates an ISO 7816-4 response status word as its <code>reason</code> code.
<a href="#">PINException</a>	PINException represents a OwnerPIN class access-related exception.
<a href="#">SystemException</a>	SystemException represents a JCSystem class related exception.
<a href="#">TransactionException</a>	TransactionException represents an exception in the transaction subsystem.
<a href="#">UserException</a>	UserException represents a User exception.

## Package javacard.framework Description

Provides Java Card API exceptions that may be re-thrown on the client.

## Hierarchy For Package javacard.framework

## Package com.sun.javacard.clientlib Description

Provides a framework for building client applications capable of exchanging APDUs with Java Cards.

`com.sun.javacard.javax.smartcard.rmiclient`

## Class `APDUExceptionSubclass`

`java.lang.Object`

└ `java.lang.Throwable`

└ `java.lang.Exception`

└ `java.lang.RuntimeException`

└ [javacard.framework.CardRuntimeException](#)

└ [javacard.framework.APDUException](#)

└ `com.sun.javacard.javax.smartcard.rmiclient.`

`APDUExceptionSubclass`

All Implemented Interfaces:

```
public class APDUExceptionSubclass
```

extends [APDUException](#)

This exception class represents a card subclass of `APDUException`. `APDUException` represents an APDU related exception on the card.

See Also:

## Constructor Detail

### APDUExceptionSubclass

```
public APDUExceptionSubclass(java.lang.String msg,  
                             short reason)
```

Constructs an APDUExceptionSubclass with the specified reason and specified error message.

**Parameters:**

msg - the associated message string  
reason - the reason for the exception.

## Method Detail

### getMessage

```
public java.lang.String getMessage()
```

Returns the error message string of this throwable object.

**Overrides:**

getMessage in class `java.lang.Throwable`

**Returns:**

the error message string of this Throwable object if it was created with an error message string; or null if it was created with no error message.

**com.sun.javacard.javax.smartcard.rmiclient**

## Class CardExceptionSubclass

```
java.lang.Object
├── java.lang.Throwable
│   ├── java.lang.Exception
│       └── javacard.framework.CardException
│           └── com.sun.javacard.javax.smartcard.rmiclient.
CardExceptionSubclass
```

### All Implemented Interfaces:

```
public class CardExceptionSubclass
```

```
extends CardException
```

This exception class represents a subclass of `CardException` on the card. The `CardException` class on the card defines a field `reason` and two accessor methods `getReason()` and `setReason()`. The `reason` field encapsulates the exception cause identifier in the Java Card API. All Java Card API checked Exception classes on the card should extend `CardException`.

### See Also:

## Constructor Summary

[CardExceptionSubclass](#)(`java.lang.String msg, short reason`)

Construct a `CardExceptionSubclass` instance with the specified reason and the specified error message.

## Method Summary

java. lang. String	<a href="#"><code>getMessage()</code></a> Returns the error message string of this throwable object.

## Class CardObjectFactory

**Direct Known Subclasses:**  
[JCCardObjectFactory](#), [JCCardProxyFactory](#)

public abstract class **CardObjectFactory**

extends java.lang.Object

This CardObjectFactory abstract class represents the base class for Java Card RMI version 2.2.2 stub generation implementations. An instance of this class is associated with one Java Card applet selection session.

Field Summary	
static byte	<a href="#">REF_FORMAT_CLASS</a> This value (=1) is used to signify that the CardObjectFactory implementation supports the Java Card RMI remote reference format using the name of the card implementation remote class.
static byte	<a href="#">REF_FORMAT_INTERFACES</a> This value (=2) is used to signify that the CardObjectFactory implementation supports the Java Card RMI remote reference format using the names of the remote interfaces implemented by the card implementation remote class.
static byte	<a href="#">REF_FORMAT_NONE</a> This value (=0) is used to signify that the CardObjectFactory implementation does not support any Java Card RMI remote reference descriptor formats.

Constructor Summary	
<a href="#">CardObjectFactory</a> ()	Creates a new CardObjectFactory for this RMI session

Method Summary	
byte	<a href="#">getINSByte</a> () returns the configured ISO 7816-4 command INS byte to be used in the Java Card platform remote method invocation command
java.lang.Object	<a href="#">getObject</a> (byte[] buffer, int tagOffset, java.lang.Class type, <a href="#">CardAccessor</a> cardAccessor) This abstract method returns the instance of the card object corresponding to the value returned from the card.
protected abstract java.rmi.Remote	<a href="#">getRemoteObject</a> (byte[] buffer, int tagOffset, <a href="#">CardAccessor</a> cardAccessor) This abstract method instantiates a stub or proxy object corresponding to the remote reference returned from the card
abstract byte	<a href="#">getRemoteRefFormat</a> () returns the format of Java Card RMI remote object reference descriptor supported.
void	<a href="#">setINSByte</a> (byte ins) Sets the ISO 7816-4 header INS byte to use for Java Card RMI method invocation commands.

Methods inherited from class java.lang.Object
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Field Detail

### REF\_FORMAT\_NONE

```
public static final byte REF_FORMAT_NONE
```

This value (=0) is used to signify that the CardObjectFactory implementation does not support any Java Card RMI remote reference descriptor formats.

See Also:  
[Constant Field Values](#)

### REF\_FORMAT\_CLASS

```
public static final byte REF_FORMAT_CLASS
```

This value (=1) is used to signify that the CardObjectFactory implementation supports the Java Card RMI remote reference format using the name of the card implementation remote class.

**See Also:**

[Constant Field Values](#)

---

## REF\_FORMAT\_INTERFACES

```
public static final byte REF_FORMAT_INTERFACES
```

This value (=2) is used to signify that the CardObjectFactory implementation supports the Java Card RMI remote reference format using the names of the remote interfaces implemented by the card implementation remote class.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### CardObjectFactory

```
public CardObjectFactory()
```

Creates a new CardObjectFactory for this RMI session

## Method Detail

### getObject

```
public java.lang.Object getObject(byte[] buffer,  
                                   int tagOffset,  
                                   java.lang.Class type,  
                                   CardAccessor cardAccessor)  
    throws java.rmi.RemoteException,  
           java.rmi.StubNotFoundException,  
           java.lang.Exception
```

This abstract method returns the instance of the card object corresponding to the value returned from the card. The value returned by the card may be any of the valid return types in Java Card RMI version 2.2

protocol format. In particular the return type may be a primitive, an array type or a remote reference descriptor or null. The method delegates processing to `getRemoteObject(...)` when the response tag is normal and expected type is a remote reference.

**Parameters:**

`cardAccessor` - used to instantiate stubs or proxies of remote objects  
`buffer` - the byte array containing the Java Card RMI version 2.2 response data  
`tagOffset` - the offset within the array where the response tag is located  
`type` - the expected return type in the response data

**Returns:**

the object associated with the response data. Primitive return value is encapsulated in a wrapper object.

**Throws:**

`java.rmi.StubNotFoundException` - if an appropriate object could not be instantiated  
`java.rmi.RemoteException` - for any RMI-specific exceptions  
`java.lang.Exception` - for exceptions thrown on the card

---

## getRemoteObject

```
protected abstract java.rmi.Remote getRemoteObject(byte[] buffer,
                                                    int tagOffset,
                                                    CardAccessor cardAccessor)
                                                    throws java.lang.Exception
```

This abstract method instantiates a stub or proxy object corresponding to the remote reference returned from the card

**Parameters:**

`buffer` - the byte array containing the JC 2.2 RMI response data  
`tagOffset` - the offset within the array where the response tag is located

**Returns:**

Stub or proxy

**Throws:**

`java.lang.Exception` - In case of error during processing

---

## setINSByte

```
public void setINSByte(byte ins)
```

Sets the ISO 7816-4 header INS byte to use for Java Card RMI method invocation commands.

**Parameters:**

ins - the ISO 7816-4 INS command header byte to use for Java Card RMI invocation commands

---

## getINSByte

```
public byte getINSByte()
```

returns the configured ISO 7816-4 command INS byte to be used in the Java Card platform remote method invocation command

**Returns:**

the ISO-7816-4 INS byte

**Since:**

Java Card 2.2

---

## getRemoteRefFormat

```
public abstract byte getRemoteRefFormat()
```

returns the format of Java Card RMI remote object reference descriptor supported. It returns one of : REF\_FORMAT\_NONE, REF\_FORMAT\_CLASS, REF\_FORMAT\_INTERFACES

**Returns:**

one of the REF\_FORMAT.. values defined above

---

`com.sun.javacard.javax.smartcard.rmiclient`

## Class `CardRuntimeExceptionSubclass`

`java.lang.Object`

└ `java.lang.Throwable`

└ `java.lang.Exception`

└ `java.lang.RuntimeException`

└ [javacard.framework.CardRuntimeException](#)

└ `com.sun.javacard.javax.smartcard.rmiclient.`

`CardRuntimeExceptionSubclass`

All Implemented Interfaces:

```
public class CardRuntimeExceptionSubclass
```

extends [CardRuntimeException](#)

This exception class represents a subclass of `CardRuntimeException` on the card. The `CardRuntimeException` class on the card defines a field `reason` and two accessor methods `getReason()` and `setReason()`. The `reason` field encapsulates exception cause identifier in the Java Card API. All Java Card API unchecked Exception classes on the card should extend `CardRuntimeException`.

See Also:

### Constructor Summary

[CardRuntimeExceptionSubclass](#)(`java.lang.String msg, short reason`)

Construct a `CardRuntimeExceptionSubclass` instance with the specified reason and the specified error message.

## Method Summary

java. lang. String	<a href="#"><code>getMessage()</code></a> Returns the error message string of this throwable object.
--------------------------	---

## Methods inherited from class javacard.framework.[CardRuntimeException](#)

└── UtilExceptionSubclass
```

### All Implemented Interfaces:

```
public class UtilExceptionSubclass
```

```
extends UtilException
```

`UtilException` represents a util related exception.

The API classes throw Java Card runtime environment-owned instances of `UtilException`.

Java Card runtime environment-owned instances of exception classes are temporary Java Card runtime environment Entry Point Objects and can be accessed from any applet context. References to these temporary objects cannot be stored in class variables, instance variables, or array components.

javacard.framework

## Class CardRuntimeException

```
java.lang.Object
├── java.lang.Throwable
│   ├── java.lang.Exception
│       ├── java.lang.RuntimeException
│           └── javacard.framework.CardRuntimeException
```

### All Implemented Interfaces:

### Direct Known Subclasses:

[APDUException](#), [BioException](#), [CardRuntimeExceptionSubclass](#), [CryptoException](#),  
[ExternalException](#), [ISOException](#), [PINException](#), [ServiceException](#), [SystemException](#),  
[TLVException](#), [TransactionException](#), [UtilException](#)

```
public class CardRuntimeException
```

```
extends java.lang.RuntimeException
```

The `CardRuntimeException` class defines a field `reason` and two accessor methods `getReason()` and `setReason()`. The `reason` field encapsulates exception cause identifier in the Java Card API. All Java Card API unchecked Exception classes should extend `CardRuntimeException`.

### See Also:

## Constructor Summary

[CardRuntimeException](#) (short reason)

Construct a CardRuntimeException instance with the specified reason.

## Method Summary

short	<a href="#"><u>getReason</u></a> () Get reason code
void	<a href="#"><u>setReason</u></a> (short reason) Set reason code.
static void	<a href="#"><u>throwIt</u></a> (short reason) Throw an instance of the CardRuntimeException class with the specified reason.

## Methods inherited from class java.lang.Throwable

fillInStackTrace, getCause, getLocalizedMessage, getMessage, getStackTrace, initCause, printStackTrace, printStackTrace, printStackTrace, setStackTrace, toString

## Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait

## Constructor Detail

### CardRuntimeException

```
public CardRuntimeException (short reason)
```

Construct a CardRuntimeException instance with the specified reason.

#### Parameters:

reason - the reason for the exception

## Method Detail

## getReason

```
public short getReason()
```

Get reason code

**Returns:**

the reason for the exception

---

## setReason

```
public void setReason(short reason)
```

Set reason code.

**Parameters:**

reason - the reason for the exception

---

## throwIt

```
public static void throwIt(short reason)  
    throws CardRuntimeException
```

Throw an instance of the `CardRuntimeException` class with the specified reason.

**Parameters:**

reason - the reason for the exception

**Throws:**

[CardRuntimeException](#) - always.

## Class CardException

```
java.lang.Object
├── java.lang.Throwable
│   └── java.lang.Exception
│       └── javacard.framework.CardException
```

All Implemented Interfaces:

Direct Known Subclasses:

[CardExceptionSubclass](#), [UserException](#)

```
public class CardException
```

```
extends java.lang.Exception
```

The `CardException` class defines a field `reason` and two accessor methods `getReason()` and `setReason()`. The `reason` field encapsulates exception cause identifier in the Java Card API. All Java Card API checked Exception classes should extend `CardException`.

See Also:

### Constructor Summary

[CardException](#)(short reason)

Construct a `CardException` instance with the specified reason.

### Method Summary

short	<a href="#"><code>getReason()</code></a> Get reason code
void	<a href="#"><code>setReason(short reason)</code></a> Set reason code.
static void	<a href="#"><code>throwIt(short reason)</code></a> Throw an instance of <code>CardException</code> class with the specified reason.

## Constructor Detail

### `CardException`

```
public CardException(short reason)
```

Construct a `CardException` instance with the specified reason.

#### Parameters:

`reason` - the reason for the exception

## Method Detail

### `getReason`

```
public short getReason()
```

Get reason code

**Returns:**

the reason for the exception

---

**setReason**

```
public void setReason(short reason)
```

Set reason code.

**Parameters:**

reason - the reason for the exception

---

**throwIt**

```
public static void throwIt(short reason)  
    throws CardException
```

Throw an instance of `CardException` class with the specified reason.

**Parameters:**

reason - the reason for the exception

**Throws:**

[CardException](#) - always.

# Class TransactionException

All Implemented Interfaces:

Direct Known Subclasses:  
[TransactionExceptionSubclass](#)

public class **TransactionException**

extends [CardRuntimeException](#)

TransactionException represents an exception in the transaction subsystem.

See Also:

Field Summary	
static short	<a href="#">BUFFER_FULL</a> This reason code is used during a transaction to indicate that the commit buffer is full.

static short	<a href="#"><u>IN_PROGRESS</u></a> This reason code is used by the beginTransaction method to indicate a transaction is already in progress.
static short	<a href="#"><u>INTERNAL_FAILURE</u></a> This reason code is used during a transaction to indicate an internal Java Card runtime environment problem (fatal error).
static short	<a href="#"><u>NOT_IN_PROGRESS</u></a> This reason code is used by the abortTransaction and commitTransaction methods when a transaction is not in progress.

Constructor Summary

<a href="#"><u>TransactionException</u></a> (short reason)
Constructs a TransactionException with the specified reason.

Method Summary

static void	<a href="#"><u>throwIt</u></a> (short reason)
	Throws an instance of TransactionException with the specified reason.

Methods inherited from class javacard.framework.[CardRuntimeException](#)

<a href="#"><u>getReason</u></a> , <a href="#"><u>setReason</u></a>
---

Methods inherited from class java.lang.Throwable

fillInStackTrace, getCause, getLocalizedMessage, getMessage, getStackTrace, initCause, printStackTrace, printStackTrace, printStackTrace, setStackTrace, toString
---

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait
--

Field Detail

## IN\_PROGRESS

```
public static final short IN_PROGRESS
```

This reason code is used by the `beginTransaction` method to indicate a transaction is already in progress.

**See Also:**

[Constant Field Values](#)

---

## NOT\_IN\_PROGRESS

```
public static final short NOT_IN_PROGRESS
```

This reason code is used by the `abortTransaction` and `commitTransaction` methods when a transaction is not in progress.

**See Also:**

[Constant Field Values](#)

---

## BUFFER\_FULL

```
public static final short BUFFER_FULL
```

This reason code is used during a transaction to indicate that the commit buffer is full.

**See Also:**

[Constant Field Values](#)

---

## INTERNAL\_FAILURE

```
public static final short INTERNAL_FAILURE
```

This reason code is used during a transaction to indicate an internal Java Card runtime

environment problem (fatal error).

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### TransactionException

```
public TransactionException(short reason)
```

Constructs a TransactionException with the specified reason.

## Method Detail

### throwIt

```
public static void throwIt(short reason)
```

Throws an instance of TransactionException with the specified reason.

**Throws:**

[TransactionException](#) - always.

javacard.framework

# Class SystemException

All Implemented Interfaces:

Direct Known Subclasses:  
[SystemExceptionSubclass](#)

public class **SystemException**

extends [CardRuntimeException](#)

SystemException represents a JCSystem class related exception.

See Also:

Field Summary	
static short	<a href="#"><b>ILLEGAL_AID</b></a>  This reason code is used by the <code>javacard.framework.Applet.register()</code> method to indicate that the input AID parameter is not a legal AID value.

static short	<b><u>ILLEGAL_TRANSIENT</u></b> This reason code is used to indicate that the request to create a transient object is not allowed in the current applet context.
static short	<b><u>ILLEGAL_USE</u></b> This reason code is used to indicate that the requested function is not allowed.
static short	<b><u>ILLEGAL_VALUE</u></b> This reason code is used to indicate that one or more input parameters is out of allowed bounds.
static short	<b><u>NO_RESOURCE</u></b> This reason code is used to indicate that there is insufficient resource in the Card for the request.
static short	<b><u>NO_TRANSIENT_SPACE</u></b> This reason code is used by the <code>makeTransient..()</code> methods to indicate that no room is available in volatile memory for the requested object.

## Constructor Summary

**SystemException**(short reason)

Constructs a `SystemException`.

## Method Summary

static void **throwIt**(short reason)

Throws an instance of `SystemException` with the specified reason.

## Methods inherited from class javacard.framework.**CardRuntimeException**

**getReason**, **setReason**

## Methods inherited from class java.lang.Throwable

`fillInStackTrace`, `getCause`, `getLocalizedMessage`, `getMessage`, `getStackTrace`, `initCause`, `printStackTrace`, `printStackTrace`, `printStackTrace`, `setStackTrace`, `toString`

## Methods inherited from class java.lang.Object

```
clone, equals, finalize, getClass, hashCode, notify, notifyAll,  
wait, wait, wait
```

## Field Detail

### ILLEGAL\_VALUE

```
public static final short ILLEGAL_VALUE
```

This reason code is used to indicate that one or more input parameters is out of allowed bounds.

**See Also:**

[Constant Field Values](#)

---

### NO\_TRANSIENT\_SPACE

```
public static final short NO_TRANSIENT_SPACE
```

This reason code is used by the `makeTransient..()` methods to indicate that no room is available in volatile memory for the requested object.

**See Also:**

[Constant Field Values](#)

---

### ILLEGAL\_TRANSIENT

```
public static final short ILLEGAL_TRANSIENT
```

This reason code is used to indicate that the request to create a transient object is not allowed in the current applet context. See *Java Card Runtime Environment Specification*, section 6.2.1 for details.

**See Also:**

[Constant Field Values](#)

---

## ILLEGAL\_AID

```
public static final short ILLEGAL_AID
```

This reason code is used by the `javacard.framework.Applet.register()` method to indicate that the input AID parameter is not a legal AID value.

**See Also:**

[Constant Field Values](#)

---

## NO\_RESOURCE

```
public static final short NO_RESOURCE
```

This reason code is used to indicate that there is insufficient resource in the Card for the request.

For example, the virtual machine for the Java Card platform may throw this exception reason when there is insufficient heap space to create a new instance.

**See Also:**

[Constant Field Values](#)

---

## ILLEGAL\_USE

```
public static final short ILLEGAL_USE
```

This reason code is used to indicate that the requested function is not allowed. For example, `JCSysyem.requestObjectDeletion()` method throws this exception if the object deletion mechanism is not implemented.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### SystemException

```
public SystemException(short reason)
```

Constructs a SystemException.

**Parameters:**

reason - the reason for the exception.

## Method Detail

### throwIt

```
public static void throwIt(short reason)  
    throws SystemException
```

Throws an instance of SystemException with the specified reason.

**Parameters:**

reason - the reason for the exception.

**Throws:**

[SystemException](#) - always.

# Class PINException

## All Implemented Interfaces:

## Direct Known Subclasses:

[PINExceptionSubclass](#)

public class **PINException**

extends [CardRuntimeException](#)

PINException represents a OwnerPIN class access-related exception.

## See Also:

Field Summary	
static short	<a href="#">ILLEGAL_VALUE</a> This reason code is used to indicate that one or more input parameters is out of allowed bounds.

## Constructor Summary

[`PINException`](#)(short reason)

Constructs a `PINException`.

## Method Summary

static void [`throwIt`](#)(short reason)

Throws an instance of `PINException` with the specified reason.

Methods inherited from class `javacard.framework.CardRuntimeException`

[`getReason`](#), [`setReason`](#)

Methods inherited from class `java.lang.Throwable`

`fillInStackTrace`, `getCause`, `getLocalizedMessage`, `getMessage`, `getStackTrace`, `initCause`, `printStackTrace`, `printStackTrace`, `printStackTrace`, `setStackTrace`, `toString`

Methods inherited from class `java.lang.Object`

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

## Field Detail

### ILLEGAL\_VALUE

```
public static final short ILLEGAL_VALUE
```

This reason code is used to indicate that one or more input parameters is out of allowed bounds.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

# PINException

```
public PINException(short reason)
```

Constructs a PINException. To conserve on resources use `throwIt()` to use the Java Card runtime-owned instance of this class.

**Parameters:**  
    `reason` - the reason for the exception.

## Method Detail

### throwIt

```
public static void throwIt(short reason)
```

Throws an instance of PINException with the specified reason.

**Parameters:**  
    `reason` - the reason for the exception.

**Throws:**  
    [PINException](#) - always.

javacard.framework

## Class ISOException

```
java.lang.Object
├── java.lang.Throwable
│   ├── java.lang.Exception
│       ├── java.lang.RuntimeException
│           └── javacard.framework.CardRuntimeException
│               └── javacard.framework.ISOException
```

**All Implemented Interfaces:**

**Direct Known Subclasses:**

[ISOExceptionSubclass](#)

---

```
public class ISOException
```

```
extends CardRuntimeException
```

ISOException class encapsulates an ISO 7816-4 response status word as its reason code.

**See Also:**

---

### Constructor Summary

[ISOException](#)(short sw)

Constructs an ISOException instance with the specified status word.

### Method Summary

static void	<a href="#"><b>throwIt</b></a> (short sw)
-------------	---

Throws an instance of the ISOException class with the specified status word.

## Methods inherited from class javacard.framework.[CardRuntimeException](#)

[getReason](#), [setReason](#)

## Methods inherited from class java.lang.Throwable

fillInStackTrace, getCause, getLocalizedMessage, getMessage, getStackTrace, initCause, printStackTrace, printStackTrace, printStackTrace, setStackTrace, toString

## Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait

## Constructor Detail

### ISOException

```
public ISOException(short sw)
```

Constructs an ISOException instance with the specified status word.

#### Parameters:

sw - the ISO 7816-4 defined status word

## Method Detail

### throwIt

```
public static void throwIt(short sw)
```

Throws an instance of the ISOException class with the specified status word.

**Parameters:**

sw - ISO 7816-4 defined status word

**Throws:**

[ISOException](#) - always.

`com.sun.javacard.rmiclientlib`

## Class JCRMIConnect

`java.lang.Object`

└─ `com.sun.javacard.rmiclientlib.JCRMIConnect`

```
public class JCRMIConnect
```

extends `java.lang.Object`

The main class of the Java Card RMI client API. Provides functionality to select a card applet and to obtain an initial reference.

### Field Summary

protected byte	<a href="#">format</a> Format of the remote references.
static byte	<a href="#">REF_WITH_CLASS_NAME</a> Constant used as the 2nd parameter to selectApplet method.
static byte	<a href="#">REF_WITH_INTERFACE_NAMES</a> Constant used as the 2nd parameter to selectApplet method.
protected byte []	<a href="#">selectResponse</a> Response to the SELECT command is stored in this field.

### Constructor Summary

[JCRMIConnect](#) ([CardAccessor](#) ca)

Creates a new instance of JCRMIConnect

## Method Summary

java. rmi. Remote	<a href="#"><code>getInitialReference()</code></a> Parses the R-APDU which was returned during selecting an applet, returns a reference to an initial remote object
byte []	<a href="#"><code>selectApplet</code></a> (byte[] aid, byte format) Selects an applet, requesting initial reference in the format specified by the 2nd parameter.

## Methods inherited from class java.lang.Object

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Field Detail

### **selectResponse**

protected byte[] **selectResponse**

Response to the SELECT command is stored in this field.

---

### **format**

protected byte **format**

Format of the remote references.

---

### **REF\_WITH\_CLASS\_NAME**

public static final byte **REF\_WITH\_CLASS\_NAME**

Constant used as the 2nd parameter to selectApplet method.

**See Also:**

[Constant Field Values](#)

---

## REF\_WITH\_INTERFACE\_NAMES

```
public static final byte REF_WITH_INTERFACE_NAMES
```

Constant used as the 2nd parameter to selectApplet method.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### JCRMIConnect

```
public JCRMIConnect(CardAccessor ca)
```

Creates a new instance of JCRMIConnect

**Parameters:**

ca - Implementaion of a CardAccessor

## Method Detail

### getInitialReference

```
public java.rmi.Remote getInitialReference()  
                        throws java.lang.Exception
```

Parses the R-APDU which was returned during selecting an applet, returns a reference to an initial remote object

**Returns:**

Stub or proxy for the initial remote object

**Throws:**

`java.lang.Exception` - If a problem occurred

---

## **selectApplet**

```
public byte[] selectApplet(byte[] aid,  
                             byte format)  
    throws java.lang.Exception
```

Selects an applet, requesting initial reference in the format specified by the 2nd parameter. The R-APDU is returned and also stored internally for further processing by the `getInitialReference()` method.

### **Parameters:**

`aid` - AID of the applet to be selected  
`format` - Format of the remote references

### **Returns:**

R-APDU

### **Throws:**

`java.lang.Exception` - If a problem occurred

---

## Class JCRemoteRefImpl

java.lang.Object

└─ com.sun.javacard.rmiclientlib.JCRemoteRefImpl

### All Implemented Interfaces:

java.io.Externalizable, java.lang.reflect.InvocationHandler, java.rmi.server.RemoteRef

```
public class JCRemoteRefImpl
```

extends java.lang.Object

implements java.rmi.server.RemoteRef, java.lang.reflect.InvocationHandler

Represents a reference to a card object. This class is a Java Card RMI implementation of the RemoteRef interface. It is used in conjunction with Java RMIC generated stubs or dynamically generated proxies for Java Card RMI method invocations.

### See Also:

### Fields inherited from interface java.rmi.server.RemoteRef

packagePrefix

## Constructor Summary

[JCRemoteRefImpl](#) (short objID, java.lang.String a\_string, [CardAccessor](#) ca, [CardObjectFactory](#) cOF)  
Creates new JCRemoteRefImpl

## Method Summary

void	<a href="#">done</a> (java.rmi.server.RemoteCall remoteCall) <b>Deprecated.</b>
java. lang. String	<a href="#">getRefClass</a> (java.io.ObjectOutput objectOutput) Unsupported operation.
java. lang. Object	<a href="#">invoke</a> (java.lang.Object obj, java.lang.reflect. Method method, java.lang.Object[] params) This method is used by dynamically generated proxies.
void	<a href="#">invoke</a> (java.rmi.server.RemoteCall remoteCall) <b>Deprecated.</b>
java. lang. Object	<a href="#">invoke</a> (java.rmi.Remote remote, java.lang.reflect. Method method, java.lang.Object[] params, long unused) This method is used by rmic-generated stubs.
java.rmi. server. RemoteCall	<a href="#">newCall</a> (java.rmi.server.RemoteObject remoteObject, java. rmi.server.Operation[] operation, int param, long param3) <b>Deprecated.</b>
void	<a href="#">readExternal</a> (java.io.ObjectInput objectInput) Unsupported operation.
boolean	<a href="#">remoteEquals</a> (java.rmi.server.RemoteRef remoteRef) Compares two remote objects for being identical.
int	<a href="#">remoteHashCode</a> () Unsupported operation.
java. lang. String	<a href="#">remoteToString</a> () String representation of remote object.
void	<a href="#">writeExternal</a> (java.io.ObjectOutput objectOutput) Unsupported operation.

## Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructor Detail

### JCRemoteRefImpl

```
public JCRemoteRefImpl(short objID,  
                        java.lang.String a_string,  
                        CardAccessor ca,  
                        CardObjectFactory cOF)
```

Creates new JCRemoteRefImpl

#### Parameters:

objID - 2 byte Object ID from card remote reference descriptor  
a\_string - Anticollision string for the class of the remote object  
cA - CardAccessor  
cOF - CardObjectFactory

## Method Detail

### getRefClass

```
public java.lang.String getRefClass(java.io.  
ObjectOutput objectOutput)
```

Unsupported operation.

#### Specified by:

getRefClass in interface `java.rmi.server.RemoteRef`

#### Parameters:

objectOutput -

---

### invoke

```
public java.lang.Object invoke(java.rmi.Remote remote,  
                                java.lang.reflect.Method method,  
                                java.lang.Object[] params,  
                                long unused)  
    throws java.io.IOException,  
           java.rmi.RemoteException,  
           java.lang.Exception
```

This method is used by rmic-generated stubs.

**Specified by:**

invoke in interface `java.rmi.server.RemoteRef`

**Parameters:**

remote - Reference to the stub - not used.

method - `java.lang.reflect.Method` object containing information about the method to be invoked.

params - Array of parameters. Primitives are wrapped.

unused - rmic-generated hash of the method. Not used.

**Returns:**

The result returned from the card.

**Throws:**

`java.io.IOException` - If a communication error occurred.

`java.rmi.RemoteException` - If an RMI error occurred.

`java.lang.Exception` - Exception corresponding to the one that was thrown on the card.

---

## remoteHashCode

```
public int remoteHashCode()
```

Unsupported operation.

**Specified by:**

remoteHashCode in interface `java.rmi.server.RemoteRef`

**Returns:**

A number which is the same for all objects.

---

## remoteToString

```
public java.lang.String remoteToString()
```

String representation of remote object.

### Specified by:

`remoteToString` in interface `java.rmi.server.RemoteRef`

### Returns:

A String representation of the remote object.

---

## readExternal

```
public void readExternal(java.io.ObjectInput objectInput)  
    throws java.io.IOException,  
           java.lang.ClassNotFoundException
```

Unsupported operation.

### Specified by:

`readExternal` in interface `java.io.Externalizable`

### Parameters:

`objectInput` -

### Throws:

`java.io.IOException`

`java.lang.ClassNotFoundException`

---

## writeExternal

```
public void writeExternal(java.io.ObjectOutput objectOutput)  
    throws java.io.IOException
```

Unsupported operation.

### Specified by:

`writeExternal` in interface `java.io.Externalizable`

### Parameters:

objectOutput -

**Throws:**

java.io.IOException

---

## newCall

```
public java.rmi.server.RemoteCall newCall(java.rmi.server.
RemoteObject remoteObject,
                                           java.rmi.server.Operation
[] operation,
                                           int param,
                                           long param3)
throws java.rmi.RemoteException
```

**Deprecated.**

Deprecated and not implemented

**Specified by:**

newCall in interface java.rmi.server.RemoteRef

**Parameters:**

remoteObject -

operation -

param -

param3 -

**Throws:**

java.rmi.RemoteException

---

## invoke

```
public void invoke(java.rmi.server.RemoteCall remoteCall)
throws java.lang.Exception
```

**Deprecated.**

Deprecated and not implemented

**Specified by:**

invoke in interface `java.rmi.server.RemoteRef`

**Parameters:**

`remoteCall` -

**Throws:**

`java.lang.Exception`

---

## **remoteEquals**

```
public boolean remoteEquals(java.rmi.server.RemoteRef remoteRef)
```

Compares two remote objects for being identical.

**Specified by:**

`remoteEquals` in interface `java.rmi.server.RemoteRef`

**Parameters:**

`remoteRef` - `RemoteRef` to the other remote object.

**Returns:**

true if corresponding remote objects are identical.

---

## **done**

```
public void done(java.rmi.server.RemoteCall remoteCall)  
    throws java.rmi.RemoteException
```

**Deprecated.**

Deprecated and not implemented

**Specified by:**

`done` in interface `java.rmi.server.RemoteRef`

**Parameters:**

`remoteCall` -

**Throws:**

`java.rmi.RemoteException`

---

## invoke

```
public java.lang.Object invoke(java.lang.Object obj,  
                                java.lang.reflect.Method method,  
                                java.lang.Object[] params)  
    throws java.io.IOException,  
           java.rmi.RemoteException,  
           java.lang.Throwable
```

This method is used by dynamically generated proxies.

### Specified by:

invoke in interface `java.lang.reflect.InvocationHandler`

### Parameters:

obj - The reference to the Proxy - not used.

method - Method object containing information about the method.

params - Array of parameters for the method.

### Returns:

The result returned from the card.

### Throws:

`java.io.IOException` - If a communication error occurred.

`java.rmi.RemoteException` - If an RMI error occurred.

`java.lang.Throwable` - Exception corresponding to the one that was thrown on the card.

com.sun.javacard.rmiclientlib

## Class JCCardProxyFactory

java.lang.Object

└ [com.sun.javacard.javax.smartcard.rmiclient.CardObjectFactory](#)

└ com.sun.javacard.rmiclientlib.JCCardProxyFactory

public class **JCCardProxyFactory**

extends [CardObjectFactory](#)

Processes the data returned from the card in the format defined for Java Card RMI. Object references must contain lists of interface names. Extends CardObjectFactory.

### Field Summary

Fields inherited from class com.sun.javacard.javax.smartcard.rmiclient.[CardObjectFactory](#)

[REF\\_FORMAT\\_CLASS](#), [REF\\_FORMAT\\_INTERFACES](#), [REF\\_FORMAT\\_NONE](#)

### Constructor Summary

[JCCardProxyFactory](#) ()

Constructor for the factory.

### Method Summary

protected java.rmi. Remote	<a href="#"><b>getRemoteObject</b></a> (byte[] buffer, int tagOffset, <a href="#">CardAccessor</a> cardAccessor) Creates the stub instance for object reference returned from the card, assuming the card returned a reference with list of interface names.
byte	<a href="#"><b>getRemoteRefFormat</b></a> () Returns constant REF_FORMAT_INTERFACES defined in class <a href="#">CardObjectFactory</a> .

### Methods inherited from class com.sun.javacard.javax.smartcard.rmiclient.[CardObjectFactory](#)

[getINSByte](#), [getObject](#), [setINSByte](#)

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

## Constructor Detail

### JCCardProxyFactory

```
public JCCardProxyFactory()
```

Constructor for the factory.

## Method Detail

### getRemoteRefFormat

```
public byte getRemoteRefFormat()
```

Returns constant REF\_FORMAT\_INTERFACES defined in class [CardObjectFactory](#).

**Specified by:**

[getRemoteRefFormat](#) in class [CardObjectFactory](#)

**Returns:**

The format constant.

---

## getRemoteObject

```
protected java.rmi.Remote getRemoteObject(byte[] buffer,
                                             int tagOffset,
                                             CardAccessor cardAccessor)
    throws java.lang.Exception
```

Creates the stub instance for object reference returned from the card, assuming the card returned a reference with list of interface names.

### Specified by:

[getRemoteObject](#) in class [CardObjectFactory](#)

### Parameters:

cardAccessor -  
buffer - APDU buffer.  
tagOffset - Offset to tag.

### Returns:

The instance of the proxy.

### Throws:

`java.lang.Exception` - Thrown if the proxy instance cannot be instantiated

com.sun.javacard.clientlib  
**Interface CardAccessor**

All Known Implementing Classes:  
[AduIOCardAccessor](#)

```
public interface CardAccessor
```

The `CardAccessor` interface represents a generic smartcard communication API. The interface based definition makes it platform and framework independent. This interface is used by Java Card RMI stubs to access the smart card.

Method Summary	
void	<a href="#">closeCard()</a> This method closes and resets the card
byte []	<a href="#">exchangeAPDU</a> (byte [] sendData) This method sends the specified data to the smartcard, waits for the response and returns the response in the return data.

**Method Detail**

**exchangeAPDU**

```
byte [] exchangeAPDU(byte [] sendData)  
           throws java.io.IOException
```

This method sends the specified data to the smartcard, waits for the response and returns the

response in the return data. The input data is assumed to be formatted for ISO 7816-4 APDU communication as follows : [0] = CLA, [1]= INS, [2] = P1, [3]= P2, [4]=Lc, [4..]= command data. The response data is formatted for ISO 7816-4 APDU communication as follows : [0] = SW1, [1]= SW2, [2..]= response data.

**Parameters:**

sendData - the ISO 7816-4 formatted command APDU data with 5 bytes of header followed by the command data.

**Returns:**

responseData contains the response received from card with the 2 status bytes followed by the response data.

**Throws:**

java.io.IOException - if communication error occurs

---

## closeCard

```
void closeCard()  
    throws java.lang.Exception
```

This method closes and resets the card

**Throws:**

java.lang.Exception - Exception with a message about the problem.

---

com.sun.javacard.clientlib

## Class ApduIOCardAccessor

java.lang.Object

└─ com.sun.javacard.clientlib.ApduIOCardAccessor

All Implemented Interfaces:

[CardAccessor](#)

```
public class ApduIOCardAccessor
```

extends java.lang.Object

implements [CardAccessor](#)

Implementation of CardAccessor using ApduIO library

### Field Summary

<pre>protected com.     sun.javacard.         apduio. CadClientInterface</pre>	
--	--

[cad](#)

Reference to underlying ApduIO object.

### Constructor Summary

[ApduIOCardAccessor](#) ()

Creates a new instance of ApduIOCardAccessor

### Method Summary

void	<a href="#"><code>closeCard()</code></a> Close and powerdown the card.
byte []	<a href="#"><code>exchangeAPDU</code></a> (byte[] capdu) Implementation of exchangeAPDU method of CardAccessor interface

### Methods inherited from class java.lang.Object

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

## Field Detail

### **cad**

protected com.sun.javacard.apduio.CadClientInterface **cad**

Reference to underlying AduIO object.

## Constructor Detail

### **ApduIOCardAccessor**

```
public ApduIOCardAccessor()
    throws java.lang.Exception
```

Creates a new instance of ApduIOCardAccessor

#### **Throws:**

java.lang.Exception - Thrown is config file jcclient.properties is not found in classpath or communication error happened.

## Method Detail

### **exchangeAPDU**

```
public byte[] exchangeAPDU(byte[] capdu)
```

throws `java.io.IOException`

Implementation of `exchangeAPDU` method of `CardAccessor` interface

**Specified by:**

[exchangeAPDU](#) in interface [CardAccessor](#)

**Parameters:**

`capdu` - byte array containing C-APDU

**Returns:**

R-APDU in the format described in the javadoc for `CardAccessor`

**Throws:**

`java.io.IOException` - In case of I/O error

---

## **closeCard**

```
public void closeCard()  
    throws java.lang.Exception
```

Close and powerdown the card.

**Specified by:**

[closeCard](#) in interface [CardAccessor](#)

**Throws:**

`java.lang.Exception` - Thrown if a problem occurred

## Field Detail

### ILLEGAL\_PARAM

```
public static final short ILLEGAL_PARAM
```

This reason code is used to indicate that an input parameter is not allowed.

**See Also:**

[Constant Field Values](#)

---

### DISPATCH\_TABLE\_FULL

```
public static final short DISPATCH_TABLE_FULL
```

This reason code is used to indicate that a dispatch table is full

**See Also:**

[Constant Field Values](#)

---

### COMMAND\_DATA\_TOO\_LONG

```
public static final short COMMAND_DATA_TOO_LONG
```

This reason code is used to indicate that the incoming data for a command in the APDU object does not fit in the APDU buffer.

**See Also:**

[Constant Field Values](#)

---

## **CANNOT\_ACCESS\_IN\_COMMAND**

```
public static final short CANNOT_ACCESS_IN_COMMAND
```

This reason code is used to indicate that the command in the APDU object cannot be accessed for input processing.

**See Also:**

[Constant Field Values](#)

---

## **CANNOT\_ACCESS\_OUT\_COMMAND**

```
public static final short CANNOT_ACCESS_OUT_COMMAND
```

This reason code is used to indicate that the command in the APDU object cannot be accessed for output processing.

**See Also:**

[Constant Field Values](#)

---

## **COMMAND\_IS\_FINISHED**

```
public static final short COMMAND_IS_FINISHED
```

This reason code is used to indicate that the command in the APDU object has been completely processed.

**See Also:**

[Constant Field Values](#)

---

## **REMOTE\_OBJECT\_NOT\_EXPORTED**

```
public static final short REMOTE_OBJECT_NOT_EXPORTED
```

This reason code is used by RMIService to indicate that the remote method returned an remote object which has not been exported.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### ServiceException

```
public ServiceException(short reason)
```

Constructs a ServiceException.

**Parameters:**

reason - the reason for the exception.

## Method Detail

### throwIt

```
public static void throwIt(short reason)  
    throws ServiceException
```

Throws an instance of ServiceException with the specified reason.

**Parameters:**

reason - the reason for the exception.

**Throws:**

[ServiceException](#) - always.

        - javacard.framework.[CardRuntimeException](#)
          - javacardx.external.[ExternalException](#)

## Package javacardx.external

Provides Java Card API exceptions that may be re-thrown on the client.

See:

[Description](#)

### Exception Summary

<a href="#">ExternalException</a>	ExternalException represents an external subsystem related exception.
-----------------------------------	---

## Package javacardx.external Description

Extension package that provides mechanisms to access memory subsystems which are not directly addressable by the Java Card runtime environment (Java Card RE) on the Java Card platform. The platform must support this optional package if an external memory access feature is included in the implementation.

The `javacardx.external` package contains the `Memory` class and the `MemoryAccess` interface. The `Memory` class provides a factory method for creating an instance of the `MemoryAccess` interface suitable for accessing supported memory subsystems.

## Package javacardx.framework.tlv

Provides Java Card API exceptions that may be re-thrown on the client.

See:

[Description](#)

### Exception Summary

<a href="#">TLVException</a>	TLVException represents a TLV-related exception.
------------------------------	--

## Package javacardx.framework.tlv Description

Extension package that contains functionality, for managing storage for BER TLV formatted data, based on the ASN.1 BER encoding rules of ISO/IEC 8825-1:2002, as well as parsing and editing BER TLV formatted data in I/O buffers.

The `javacardx.framework.tlv` package contains the `BERTag` abstract class, and its concrete subclasses `PrimitiveBERTag` and `ConstructedBERTag`. These classes encapsulate the BER tag functionality.

The `javacardx.framework.tlv` package also contains the `BERTLV` abstract class, and its concrete subclasses `PrimitiveBERTLV` and `ConstructedBERTLV`. These classes encapsulate the BER TLV functionality.

  - java.lang.Throwable
    - java.lang.Exception
      - java.lang.RuntimeException
        - javacard.framework.[CardRuntimeException](#)
          - javacardx.framework.util.[UtilException](#)

## Package javacardx.framework.util

Provides Java Card API exceptions that may be re-thrown on the client.

See:

[Description](#)

### Exception Summary

<a href="#">UtilException</a>	UtilException represents a util related exception.
-------------------------------	--

## Package javacardx.framework.util Description

Extension package that contains common utility functions for manipulating arrays of primitive components - byte, short or int. If the int primitive type is supported by the platform, the intx sub-package must be included.

The javacardx.framework.util package contains the ArrayLogic class. The ArrayLogic class provides methods for functionality similar to that of the javacard.framework.Util class but with generic Object component equivalents.

`javacardx.framework.util`

## Class `UtilException`

```
java.lang.Object
├── java.lang.Throwable
│   ├── java.lang.Exception
│       ├── java.lang.RuntimeException
│           └── javacard.framework.CardRuntimeException
│               └── javacardx.framework.util.UtilException
```

**All Implemented Interfaces:**

**Direct Known Subclasses:**

[UtilExceptionSubclass](#)

---

```
public class UtilException
```

```
extends CardRuntimeException
```

`UtilException` represents a util related exception.

The API classes throw Java Card runtime environment-owned instances of `UtilException`.

Java Card runtime environment-owned instances of exception classes are temporary Java Card runtime environment Entry Point Objects and can be accessed from any applet context. References to these temporary objects cannot be stored in class variables, instance variables, or array components.

## Field Detail

### INVALID\_PARAM

```
public static final short INVALID_PARAM
```

This reason code is used to indicate that one or more input parameters is invalid.

**See Also:**

[Constant Field Values](#)

---

## ILLEGAL\_SIZE

```
public static final short ILLEGAL_SIZE
```

This reason code is used to indicate that the size of a TLV or Tag representation in the input parameter is greater than the supported size or will result in in a TLV struture of greater than supported size

**See Also:**

[Constant Field Values](#)

---

## EMPTY\_TAG

```
public static final short EMPTY_TAG
```

This reason code is used to indicate that the Tag object is empty

**See Also:**

[Constant Field Values](#)

---

## EMPTY\_TLV

```
public static final short EMPTY_TLV
```

This reason code is used to indicate that the TLV object is empty

**See Also:**

[Constant Field Values](#)

---

## MALFORMED\_TAG

```
public static final short MALFORMED_TAG
```

This reason code is used to indicate that the tag representation is not a well-formed BER Tag

**See Also:**

[Constant Field Values](#)

---

## **MALFORMED\_TLV**

```
public static final short MALFORMED_TLV
```

This reason code is used to indicate that the TLV representation is not a well-formed BER TLV

**See Also:**

[Constant Field Values](#)

---

## **INSUFFICIENT\_STORAGE**

```
public static final short INSUFFICIENT_STORAGE
```

This reason code is used to indicate that the configured storage capacity of the object will be exceeded

**See Also:**

[Constant Field Values](#)

---

## **TAG\_SIZE\_GREATER\_THAN\_127**

```
public static final short TAG_SIZE_GREATER_THAN_127
```

This reason code is used to indicate that the size of the tag representation is greater than 127 bytes

**See Also:**

[Constant Field Values](#)

---

## TAG\_NUMBER\_GREATER\_THAN\_32767

```
public static final short TAG_NUMBER_GREATER_THAN_32767
```

This reason code is used to indicate that the tag number value greater than 32767

**See Also:**

[Constant Field Values](#)

---

## TLV\_SIZE\_GREATER\_THAN\_32767

```
public static final short TLV_SIZE_GREATER_THAN_32767
```

This reason code is used to indicate that the TLV requires more that 32767 bytes to represent

**See Also:**

[Constant Field Values](#)

---

## TLV\_LENGTH\_GREATER\_THAN\_32767

```
public static final short TLV_LENGTH_GREATER_THAN_32767
```

This reason code is used to indicate that the Length component value in the TLV is greater than 32767

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### TLVException

```
public TLVException(short reason)
```

Constructs a `TLVException` with the specified reason. To conserve on resources use `throwIt()` to use the Java Card runtime environment-owned instance of this class.

**Parameters:**

`reason` - the reason for the exception

## Method Detail

### **throwIt**

```
public static void throwIt(short reason)
```

Throws the Java Card runtime environment-owned instance of `TLVException` with the specified reason.

Java Card runtime environment-owned instances of exception classes are temporary Java Card runtime environment Entry Point Objects and can be accessed from any applet context. References to these temporary objects cannot be stored in class variables or instance variables or array components. See *Runtime Environment Specification for the Java Card Platform*, section 6.2.1 for details.

**Parameters:**

`reason` - the reason for the exception

## ILLEGAL\_USE

```
public static final short ILLEGAL_USE
```

This reason code is used to indicate that the method should not be invoked based on the current state of the card.

**See Also:**

[Constant Field Values](#)

## Constructor Detail

### BioException

```
public BioException(short reason)
```

Construct a new biometric exception using a provided reason code. To conserve on resources use `throwIt()` to use the Java Card runtime environment instance of this class.

**Parameters:**

`reason` - the reason code for this exception.

## Method Detail

### throwIt

```
public static void throwIt(short reason)  
    throws BioException
```

Throws the Java Card runtime environment owned instance of `BioException` with the specified reason. Java Card runtime environment owned instances of exception classes are temporary Java Card runtime environment Entry Point Objects and can be accessed from any applet context. References to these objects cannot be stored in class variables or instance variables or array components.

**Parameters:**

reason - the reason for the exception.

**Throws:**

[BioException](#) - always.
